Doboz For .NET

Doboz For .NET Torrent Download For PC

Doboz for.NET supports most popular formats such as GZIP, XZ, LZMA, and LZH. The library provides compression classes for Stream, MemoryStream, BufferedStream, FileStream, FileInfo, FileInfo/Directory, Assembly, and for XmlReader/XmlWriter. The.NET version of the library was developed and is maintained by the same developer of the original Doboz decompressor and compressor libraries. Doboz for.NET Features: • Encoding using a variety of compression algorithms, including GZIP, LZMA, and LZH, for streams and streams as well as byte arrays. • Data is stored using memory or streams. • Supports both single and multi-threaded applications. • Supports many popular platforms such as Linux, Windows, Mac, etc. Doboz for.NET Downloads: • Reference DLLs: Doboz for.NET (.NET 2.0 and higher) Souce Code Doboz for.NET can be downloaded from the developer's website: Simply visit the website, search for the LZH and GZIP option, and download one of the.NET.dll's. There are two versions, one for.NET 2.0 and higher and one for.NET 1.1 and lower. • Full.NET version Includes: doboz-net.zip Readme.txt doboz-net-2.0-sdk.zip Compression Algorithm Examples: LZMA: 1. Convert a very long string into a stream to save space. 2. Convert a very long string into a stream to save space. In order for the LZMA algorithm to save the largest amount of space, the entropy of the data must be maximized. Heuristic: The more bytes that need to be compressed, the more entropy is required. • XZ algorithm LZMA compression algorithm compresses a string into a stream. Heuristic: The more bytes that need to be compressed, the more entropy is required. • LZH algorithm LZH is an algorithm that uses "reversible" compression. Reversible compression is one-way, such that the original data can be recovered without error, but the original data cannot be

Doboz for.NET is a high performance programming language for.NET platform. The implementation is based on the popular LZ library, written by Ron Tom and available for.NET, as well as for several embedded platforms. Doboz for.NET provides a range of features and optimizations that were designed to provide maximum performance for both compression and decompression. Doboz for.NET LZ compression functions are: * Body algorithm of LZ is converted to binary using all look-ahead bytes to get maximum compression efficiency. * Look-ahead bytes are skipped to improve compression ratio. * Found matches in previously traversed body are used as a secondary compression. * Code is optimized for the large majority of cases. * Compression and decompression functions are implemented as highly optimized loops. * The algorithm is statically and dynamically configurable, allowing full control of the algorithms parameters. * The coding mode (Huffman or RLE) is automatically selected based on the input data. * You can select file format, which controls the way the input data is stored in the final compressed file. Doboz for.NET Uses: Doboz for.NET can be used as a stand-alone compression / decompression library. You can also use it as an add-on library, to compress or decompress LZ streams within the classic.NET Framework programming models, like ADO.NET, WCF, WPF, CLR, etc... This library does not require.NET Framework 2.0 or higher. Doboz for.NET Programming Examples: {** * * DOBOZ FOR.NET DEMO PROGRAM * * 09e8f5149f

The Library provides complete set of routines to compress text and binary file. Doboz for.NET comes with a complete set of routines to compress and decompress data. Doboz for.NET is a set of routines which provide very fast compression and decompression algorithm. It uses static dictionary, which is generated from unique data to achieve compression ratio of more than 90%. Doboz for.NET offers huge amount of routines for different text data types like byte, unicode, string, ascii, hexadecimal, decimal, etc. The compression routine is generated automatically from the configuration file. Doboz for.NET supports single files, archives, files of compressed files and a collection of files. It offers the following routines to perform various compression: Compress - decompose files Uncompress - reconstruct files Algorithm - algorithms are being used by Doboz for.NET to compress files. Doboz for.NET is a very simple and easy-to-use programming class. It can be used to compress data with various algorithms. It is also compatible with.NET Framework. What's New In?

Doboz for.NET is an extension library for the C# programming language. It supports the creation of algorithms on.NET platform using the library and enables the implementation of various compression algorithms. The library consists of two parts: a. a command-line interface. This part is essential for the implementation and uses CSC (Create Source Code) to write the core algorithm. b. an application programming interface (API). The API provides a friendly set of functions used by programmers to integrate the library with their applications. The API is divided into two main parts: 1. Compression. The compression API consists of the methods used for compression (binarize, split and join) and parsing arguments. The compression API does not provide support for decompression, but can be used to split the text to be compressed and to add the compression procedure to your existing application. 2. Test. The test API has the methods used for testing (decompress, count, get size, get size, copy and get content) and to show the compression ratio. This API also provides information about the compression algorithm used. Different aspects of the API are described in more detail in the following chapters.
